

# Workflow Automation with Vision Agents

Build and run Vision AI Agents that work with your existing applications, no APIs or infrastructure required.

## The Problem

Most business-critical applications were built for people, not automation. They don't have APIs, and traditional RPA tools can't bridge the gap without heavy scripting, virtual desktops, or fragile connectors. As a result, automation pilots stall, security risks rise, and the cost of scaling agents outweighs the benefit.

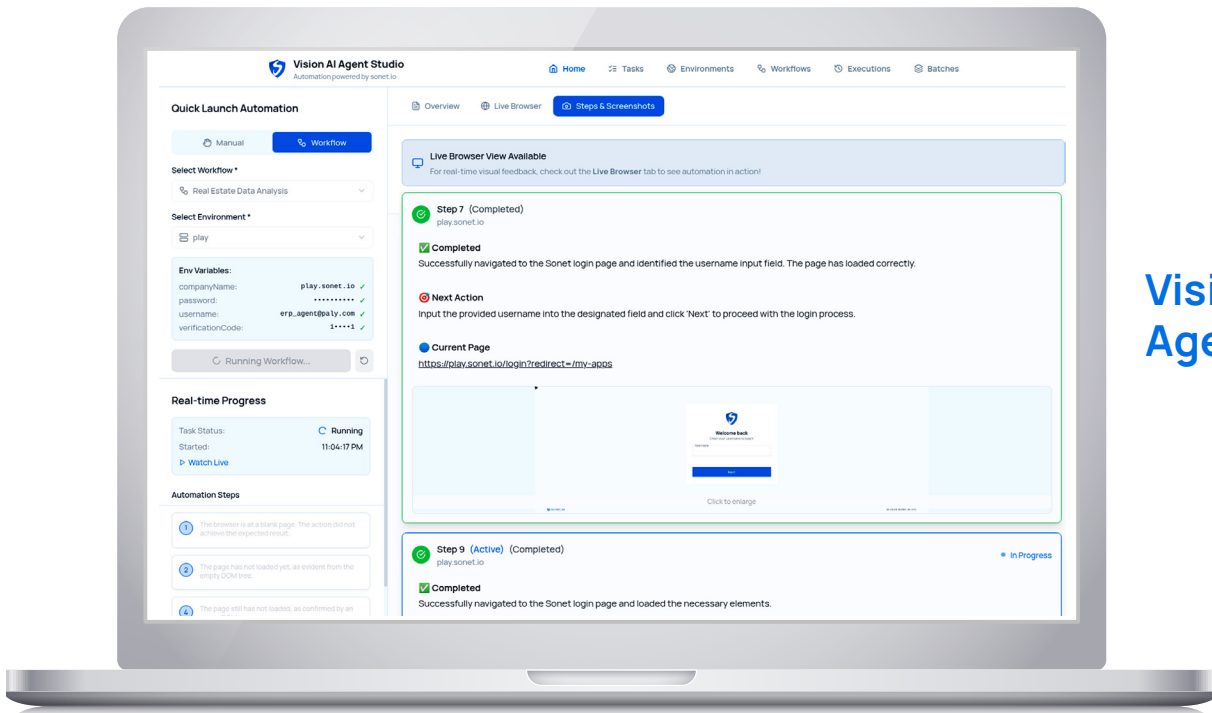

Technology leaders want to move faster and use AI to do it. Many are under pressure to deliver secure, visible results but face the reality that current tools were never designed for agents. They are tasked with implementing AI across the enterprise but lack a safe, measurable way to show early success. Without an environment where agents can operate securely across existing applications, AI initiatives remain stuck in proof-of-concept mode.

## The Solution

Sonet.io makes Vision Agents practical for real enterprise environments. Vision Agents run inside a secure browser workspace that can see and act on any application, Windows or web, without APIs, MCP servers, or RPA software.

Through Agent Studio, teams can create these agents by recording an expert completing the task, test them safely, and deploy them instantly with enterprise-grade controls already in place. Every session inherits Sonet.io's zero trust, DLP, and recording policies, giving IT complete visibility and governance over every action an agent performs.

For IT and security leaders, this provides a clear and fast way to deliver value with AI. Vision Agents show measurable results within days, using the same security framework already trusted for human users.

## Vision AI Agent Studio

### Key Benefits

#### Enable AI Automation Fast

- Launch Vision Agent pilots in days, not months
- Build and deploy agents with auto-generated prompts using Agent Studio
- Deliver measurable AI results quickly without coding or infrastructure

#### Zero Trust Security for Agents

- Every agent runs inside a Sonet-controlled browser workspace
- Full session recording, audit trails, DLP, and MFA included
- Apply the same policies and identity controls used for people

#### Simplify Operations and Prove ROI

- Use existing Windows and web apps—no APIs or RPA tools required
- Scale agents instantly through your current SSO and browser access
- Lower total cost with one secure workspace for users and agents

### Key Capabilities

- **Sonet-Controlled Browser Workspace.** Run users and Vision Agents together in a hardened browser environment with policy enforcement, isolation, and continuous patching.
- **Agent Studio.** Create and manage Vision Agents by recording an expert completing the task. Build and test workflows quickly, then deploy securely within the browser workspace.
- **Secure Application Delivery.** Deliver Windows, web, and internal applications through the browser, including legacy apps with no API support, with no endpoint software, virtual desktops, or VPNs.
- **Zero Trust Enforcement.** Apply least-privilege policies, DLP, and recording to both users and agents. Every session runs under the same governance and security controls.
- **Observability and audit.** Record every session and capture detailed activity logs for users and agents. Export data to your SIEM for monitoring, compliance, and proof of control.

## Getting Started is Simple

- Connect your SSO and publish one Windows or web app to the Sonet browser workspace.
- Create your first Vision Agent in Agent Studio by recording yourself doing the task.
- Run a supervised test, review the session recording, and validate policy coverage.

- Add additional workflows using the same app or department.
- Apply zero trust, DLP, and identity policies to both users and agents.
- Review audit logs and share early results with your security and operations teams.

- Extend Vision Agents to new teams and applications, including legacy Windows apps without APIs.
- Streamline governance with centralized visibility and consistent enforcement.
- Deliver measurable AI outcomes safely and quickly without new infrastructure.

### Why Sonet.io

Sonet.io delivers secure application access and automation through a single, browser-based workspace. Vision Agents extend that power to workflows that were never designed for APIs, giving IT leaders a fast, secure way to show real AI results.

#### Everything you need, nothing you don't.

- One enforcement boundary
- No infrastructure burden
- Fast path to AI success
- Agent Studio built in
- Works with legacy and API-free applications
- Enterprise-grade zero trust
