

Deliver AX 2012 Like It's 2026

Run Legacy AX, GP, and NAV in a browser with modern security. No VDI, no VPN, no agents.

Legacy AX, GP, and NAV applications still run the business. What's breaking is the way they're delivered. Keeping users productive on legacy clients costs time and budget, and it creates security work you don't need. Sonet.io is an application delivery platform that streams your Dynamics apps to any user through the browser. There is nothing to install on devices and no infrastructure to manage. Admins publish apps and policies in minutes. Users log in and get to work.

Why This Matters Now

D365 migrations take longer than contract renewals, so "just keep Citrix for another year" becomes an expensive habit. Hybrid teams and contractors make device shipping and client installs slow and brittle. Meanwhile, expectations have changed. Zero Trust, MFA, DLP, session recording, and audit-ready visibility are now table stakes. The skills to maintain older ERP stacks are shrinking, which means simpler delivery and admin are worth real money.

How Sonet.io Delivers Legacy Dynamics

Sonet.io renders AX, GP, and NAV in the browser while your data stays protected in your environment. Access runs through your SSO. Policies control who gets in, from where, and what they can do. Session recording, watermarking, and DLP are built in, so security is consistent without endpoint agents. Printing works. Multi-monitor works. Shared folders and persistent user storage are available. Because there is no desktop client to deploy, onboarding a new group takes minutes, not weeks.

What Changes for IT

You remove layers. No VDI farms to tune. No VPN clients to troubleshoot. No device imaging or shipping for short-term workers. Admins manage one console for access, policies, and visibility, and they spend more time enabling the business, not propping up delivery tools. Finance gets predictable cost. Security gets end-to-end observability. Users get their ERP in a browser that actually performs.

What You can Prove in 30 days

You remove layers. No VDI farms to tune. No VPN clients to troubleshoot. No device imaging or shipping for short-term workers. Admins manage one console for access, policies, and visibility, and they spend more time enabling the business, not propping up delivery tools. Finance gets predictable cost.
